

Using oTree LabLauncher

Put your oTree project on the lab computer, in a folder on the desktop identified with your name. The oTree Lab Launcher is a shortcut on that desktop that opens the app. Your lab manager sets it up once, and after that any oTree study runs from the launcher.

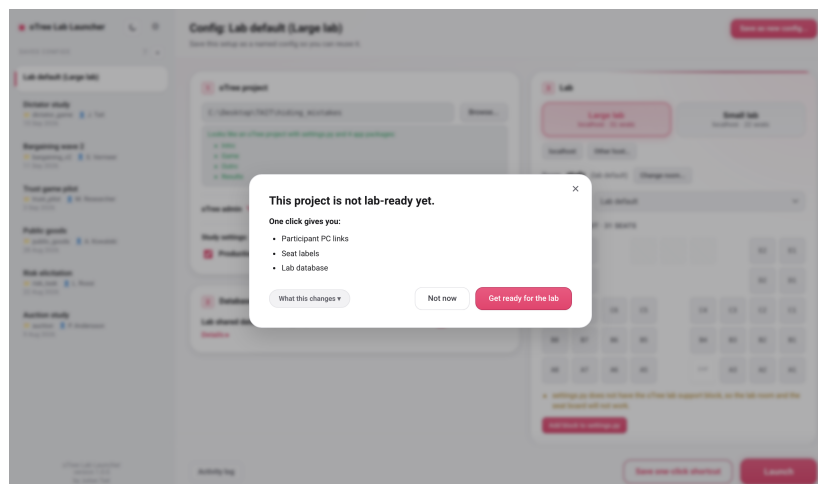

0. Put your project on the lab computer, in a desktop folder named after you.
1. Double-click **Start oTree LabLauncher** on the desktop (the shortcut with the little icon).

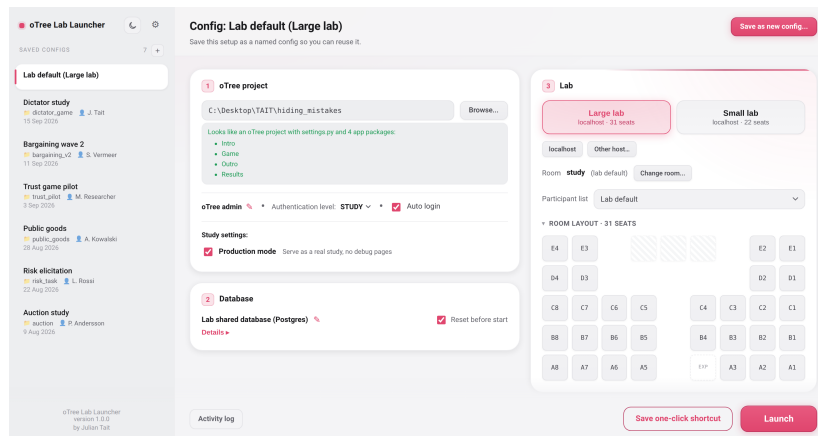

2. Click **Browse** and point it at your oTree study folder.

3. Get it ready for the lab. In one step this wires up the participant computer seat links, the seat labels, and the shared lab database.

4. Launch. This starts the server and makes each lab computer open its own seat link.

5. Optional: Save a one-click shortcut to the desktop for next time.

Tips and troubleshooting

- **Running one session across both labs at once.** To pool the small and large lab into a single session, pick one computer to host the server, get ready as normal, and set the participant list to None before launching. When a participant list is selected, oTree only admits the seat labels that appear in it, so the other lab's seat labels are refused. With the participant list set to None, any label is accepted, so both labs can join the same session.
