

Using oTree LabLauncher

The oTree Lab Launcher is a file on the lab computer desktop that opens the app. Your lab manager sets it up once, and after that any oTree study runs in three clicks.

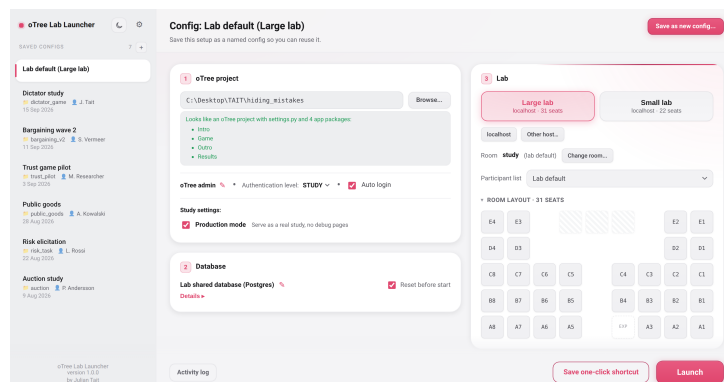

1. Click **Browse** and point it at the study folder.

2. Click **Get ready for the lab**. In one step this wires up the participant computer seat links, the seat labels, and the shared lab database.

3. Click **Launch**. This starts the server and makes each lab computer open its own seat link.

Tips and troubleshooting

Running one session across both labs at once. To pool the small and large lab into a single session, pick one computer to host the server, get ready as normal, and set the participant list to None before launching. When a participant list is selected, oTree only admits the seat labels that appear in it, so the other lab's seat labels are refused. With the participant list set to None, any label is accepted, so both labs can join the same session.
