Run oTree studies **easily** with LabLauncher

Put your oTree project in a folder with your name.

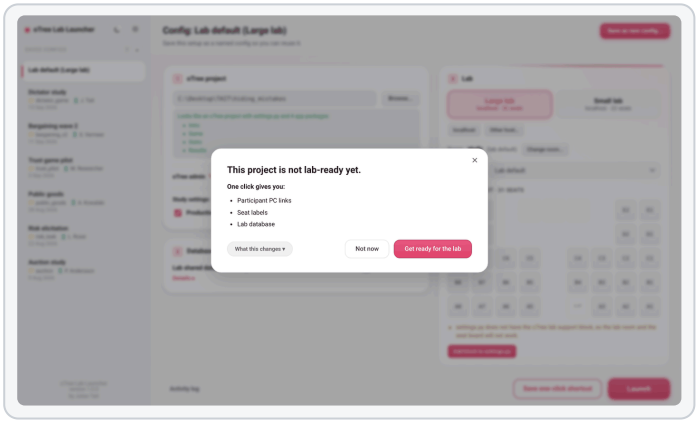

1 **Start oTree LabLauncher** from the desktop.

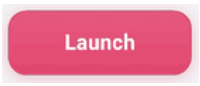

2 **Browse** locally, or pick a repository in the **CREED-UvA** GitHub organisation.

3 Get **lab-ready**: wires up the database, seat links and labels.

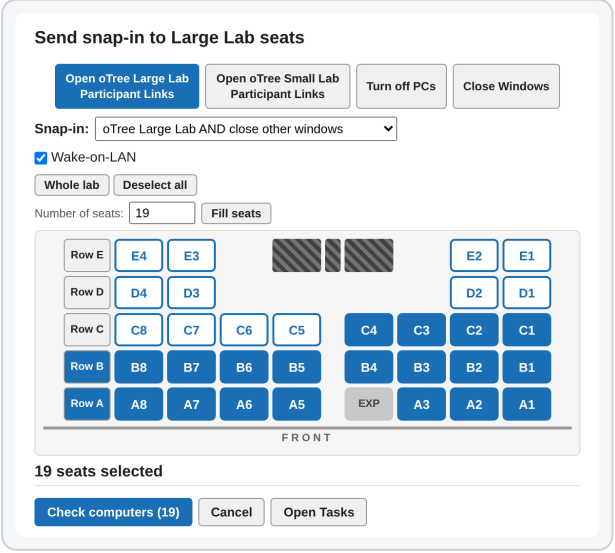

4 **Launch**.

5 **Join from participant PCs**.

Use the desktop links (**oTree - Small Lab** or **oTree - Large Lab**), or send them over **FOG** (as seen on the right, ask Estonia for log-ins and details).

Optional: save a one-click shortcut to the desktop.

Use GitHub instead of a USB stick

CREED has a GitHub organisation, **CREED-UvA**. Studies in it can be downloaded straight onto the lab computers.

01 **Access.** Ask Estonia to add you to **CREED-UvA** (https://github.com/CREED-UvA).

02 **Add your study.** Create a private repository in CREED-UvA and push. Already in your own repository? Run once, so `git push` updates both:

```
git remote set-url --add --push origin <your current repository URL>
git remote set-url --add --push origin https://github.com/CREED-UvA/<your-study>.git
```

Both needed: the first `--add` replaces the default address. `git remote -v` should list two *(push)* lines.

03 **Clone in the lab.** Click **GitHub** in the LabLauncher, pick the repository and your name, then **Clone**.

04 **Updates to your study?** The LabLauncher checks GitHub each time you open your study, and offers **Git Pull** if there are changes.

Tips and tricks

Pool both labs: set the participant list to *None* before launching.
